Question: An urn contains 25 balls of which 10 balls bear a mark X and the remaining 15 bear a mark Y. A ball is drawn at random from the urn, its mark is noted down and it is replaced. If 6 balls are drawn in this way, find the probability that

1) all will bear X mark.

2) not more than 2 will bear Y mark.

3) at least one ball will bear Y mark.

4) the number of balls with X mark and Y mark will be equal.

Solution:

Parameter	Values	Description
n	6	Number of draws
p_X	0.4	Probability that ball bears X mark
p_Y	0.6	Probability that ball bears X mark

TABLE 0

DEFINITION OF PARAMETERS

1) all will bear 'X mark Mean is given by

$$\mu = np_X \tag{1}$$
$$= 2.4 \tag{2}$$

Standard Deviation is given by

$$\sigma = \sqrt{np_X(1 - p_X)} \tag{3}$$
$$= \sqrt{6 \times 0.4 \times (1 - 0.4)} \tag{4}$$
$$= \sqrt{6 \times 0.4 \times 0.6} \tag{5}$$
$$= 1.2 \tag{6}$$

We have,

$$Z = \frac{X - \mu}{\sigma} \tag{7}$$
$$= 3 \tag{8}$$

Hence, from standard distribution table of Z, we have

$$\Pr(Z \leq 3) = 0.49865 \tag{9}$$
$$= 49.865\% \tag{10}$$

2) not more than 2 will bear Y mark.
   Mean is given by

$$\mu = np_Y \tag{11}$$
$$= 3.6 \tag{12}$$

Standard Deviation is given by

$$\sigma = \sqrt{np_Y(1 - p_Y)} \tag{13}$$
$$= \sqrt{6 \times 0.6 \times 0.4} \tag{14}$$
$$= 1.2 \tag{15}$$

We need to find

$$\Pr(X \le 2) = 0.30854 \tag{16}$$

We have,

$$Z = \sum_{i=0}^{2} \frac{X_i - \mu}{\sigma} \tag{17}$$
$$= -3.5 \tag{18}$$

Hence, from standard distribution table of Z, we have

$$\Pr(Z \le 3) = 0.49865 \tag{19}$$
$$= 49.865\% \tag{20}$$

3) at least one ball will bear Y mark.
Mean is given by

$$\mu = np_Y \tag{21}$$
$$= 3.6 \tag{22}$$

Standard Deviation is given by

$$\sigma = \sqrt{np_Y(1 - p_Y)} \tag{23}$$
$$= \sqrt{6 \times 0.6 \times 0.4} \tag{24}$$
$$= 1.2 \tag{25}$$

$$\Pr(X \ge 1) = 0.98487 \tag{26}$$

4) the number of balls with X mark and Y mark will be equal.

$$\Pr(2.4 \le X \le 3.6) \tag{27}$$

from standard distribution table of Z, we have

$$\Pr(2.4 \le Z \le 3.6) = 0.34134 \tag{28}$$
$$= 34.134\% \tag{29}$$
